

1      **ABSTRACT**

2      The described subject matter provides context-sensitive help for a Web-  
3      based UI. A first and a second computer are operatively coupled to one-another  
4      over a network such as the Internet, an organizational intranet, or the like. The first  
5      computer communicates a Web-based UI to the second computer. The  
6      communicated Web-based UI includes a first Web page corresponding to a number  
7      of predetermined functions of the first computer. Responsive to receiving a  
8      request for help corresponding to the first Web page, the first computer,  
9      determines/identifies the first Web page's context sensitive information. The first  
10     computer generates a second Web page that includes the identified context-  
11     sensitive information, and communicates the second Web page to the second  
12     computer for display. In this manner, the first computer provides context-sensitive  
13     help for its remotely displayed Web-based UI.
